Flue Pipe & Stove Top Thermometers

It is very important to ensure that any appliance is operating at the correct temperature.

A thermometer allows you to monitor the flue gas temperature is always at the optimum heat, as recommended by the appliance manufacturer.

This thermometer has a magnetic fixing which allows it to affix to vitreous enamelled flue pipes. For single wall stainless steel flue pipes the fixing wire will hold the thermometer in position on the flue pipe.

If twin wall insulated flue system is used, the thermometer would not be able to give an accurate temperature, as the insulation would keep the external temperature low, so the thermometer can be magnetically fixed to the stove top.

Please be aware that long periods of slumber should always be avoided, as this will harm the flue system and could invalidate the flue warranty. This thermometer is the easy way to check the burning temperature and avoid this potentially dangerous situation.

All lettering is 17 Carat gold.
