

## 4 Blade Heat Powered Stove Fan

FIR360

The heat powered stove fan is designed to circulate the warm air created by a stove. Improved warm air circulation results in greater comfort and less fuel consumption. It is self powered using heat from the stove and does not need batteries or mains power.

### Improved Efficiency:

Warm air is moved towards the centre of the room rather than simply rising to the ceiling as it leaves the fireplace, improving the circulation of warmth to enhance your comfort.

### Concept:

The slender anodized aluminium 4 blade design gently moves and distribute air over a wider area thus eliminating drafts or wind blasts.

- Upto 50% more air flow than our original 2 blade design
- Virtually silent in operation
- Gently circulate heat throughout the room
- Maximise energy from the stove and reduce fuel consumption
- Operating range 100-300c
- Attractive, durable design
- Satin black anodised blades

### Specifications:

Height (including blade): ..... 230mm  
 Width (including blade):..... 200mm  
 Base plate width: ..... 100mm  
 Weight:..... 800g
